

Our generation gets tons of sh*t for not using our brains and outsourcing everything to AI. There's nuggets of truth there, sure, but clearly we are all not that lazy. We take great pride in the work we do and the things we learn.

We have simply been moulded by an unforgiving economy of time. As everything accelerates, choosing the hard path becomes more expensive by the second. Today's AI tools are built to eliminate problems as quickly as possible, not to develop the person solving them. They deliver answers, but often remove the productive struggle through which learning actually happens.

Specialised AI learning tools don't see the root of the problem: **fundamentals, fundamentals, fundamentals.**

Until now.

Lattice transforms a university course into a **personal, evidence-grounded learning system.**

Ask helps students understand difficult concepts through cited answers drawn from their actual Materials.

Note Review confronts misconceptions by checking students' own claims against official evidence.

Grill Me turns any selected Material into active-recall practice and points students back to what they have not yet mastered.

The result is not another chatbot that completes work for students. It is an AI learning companion that keeps students inside the intellectual loop: questioning, correcting and practising until the knowledge becomes theirs.

For universities, Lattice offers something generic AI cannot: assistance grounded in the institution's own curriculum, delivered through controlled access and verifiable sources. We enter course by course through lecturer champions, distribute through official channels, and expand department by department as engagement and trust accumulate.

Our moat is not a chat interface. It is the compounding combination of structured course knowledge, deeply embedded learning workflows and institutional trust. Built within NUS and closely connected to AICET 😊, Lattice begins with the credibility and access needed to deploy in real classrooms—where competitors cannot simply generate their way in.

The next generation of education will not be won by whoever automates learning fastest. It will be won by whoever proves that AI can restore the time, confidence and breathing room required to learn deeply.

Lattice does not think for students. It helps students become people who can think for themselves.
